## 1 Introduction and functional overview

This specification specifies the functionality, API and the configuration of the AUTOSAR Basic Software module SOME/IP TP.

The task of the SOME/IP TP module is to segment SOME/IP packets, which do not fit into one single UDP packet. On the reception side, it re-assembles the received SOME/IP segments.

# 2 Acronyms and abbreviations

Abbreviation / Acronym:	Description:
SOME/IP	Scalable service-Oriented MiddlewarE over IP

#### 3.2 Related standards and norms

[7] IEC 7498-1 The Basic Model, IEC Norm, 1994

## 3.3 Related specification

AUTOSAR provides a General Specification on Basic Software (SWS BSW General)[3] which is also valid for the SOME/IP TP module.

Thus, the specification SWS BSW General [3]shall be considered as additional and required specification for SOME/IP TP module.

## 4 Constraints and assumptions

#### 4.1 Limitations

The SOME/IP TP is a simple protocol to segment SOME/IP messages. It does not implement retry mechanism nor does it reordering of received SOME/IP segments.

These limitations are intended to spare runtime and memory resources on receiver side. Nonetheless, this is a deviation from the AUTOSAR SOME/IP Protocol Specification (PRS\_SOMEIP\_00747 to PRS\_SOMEIP\_00754).

The rational for these limitations is the typical use-case which is "streaming" of large SOME/IP messages.

## 4.2 Applicability to car domains

This module is applicable for SOME/IP communication.

# 5 Dependencies to other modules

#### 5.1 AUTOSAR PDU Router

The SOME/IP TP module uses the PduR for both directions, the transmission path, and the reception path.

#### 5.2 AUTOSAR Default Error Tracer

In order to be able to report development errors, the SOME/IP TP module has to have access to the error hook of the Default Error Tracer.

# 6 Requirements traceability

Requirement	Description	Satisfied by
RS_SOMEIP_00010	SOME/IP protocol shall support different transport protocols underneath	SWS_SomelpTp_00001, SWS_SomelpTp_00002, SWS_SomelpTp_00004, SWS_SomelpTp_00005, SWS_SomelpTp_00006, SWS_SomelpTp_00008, SWS_SomelpTp_00010, SWS_SomelpTp_00011, SWS_SomelpTp_00012, SWS_SomelpTp_00013, SWS_SomelpTp_00014, SWS_SomelpTp_00015, SWS_SomelpTp_00016, SWS_SomelpTp_00017, SWS_SomelpTp_00018, SWS_SomelpTp_00017, SWS_SomelpTp_00018, SWS_SomelpTp_00019, SWS_SomelpTp_00020, SWS_SomelpTp_00021, SWS_SomelpTp_00022, SWS_SomelpTp_00023, SWS_SomelpTp_00024, SWS_SomelpTp_00025, SWS_SomelpTp_00026, SWS_SomelpTp_00027, SWS_SomelpTp_00028, SWS_SomelpTp_00029, SWS_SomelpTp_00032, SWS_SomelpTp_00033, SWS_SomelpTp_00034, SWS_SomelpTp_00035, SWS_SomelpTp_00036, SWS_SomelpTp_00037, SWS_SomelpTp_00038, SWS_SomelpTp_00037, SWS_SomelpTp_00038, SWS_SomelpTp_00034, SWS_SomelpTp_00041, SWS_SomelpTp_00042, SWS_SomelpTp_00045, SWS_SomelpTp_00048, SWS_SomelpTp_00049, SWS_SomelpTp_00051, SWS_SomelpTp_00054, SWS_SomelpTp_00062, SWS_SomelpTp_00063, SWS_SomelpTp_00064

# Specification on SOME/IP Transport Protocol AUTOSAR CP Release 4.4.0

	Module specifications shall specify at least in the description which other modules they require	
SRS_BSW_00407	Each BSW module shall provide a function to read out the version information of a dedicated module implementation	SWS_SomelpTp_00044, SWS_SomelpTp_00046
SRS_BSW_00411	All AUTOSAR Basic Software Modules shall apply a naming rule for enabling/disabling the existence of the API	SWS_SomelpTp_00044, SWS_SomelpTp_00046
SRS_BSW_00425	The BSW module description template shall provide means to model the defined trigger conditions of schedulable objects	SWS_SomelpTp_00058, SWS_SomelpTp_00059, SWS_SomelpTp_00069, SWS_SomelpTp_00070

# 7 Functional specification

The task of the SOME/IP TP module is to segment SOME/IP packets, which do not fit into one single UDP packet. On the reception side, it assembles the received SOME/IP segments.

The SOME/IP TP module interacts with the PDU Router for both directions, the transmission and the reception path.

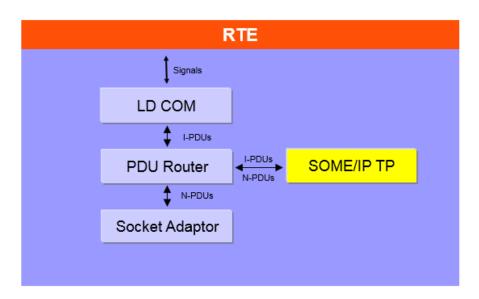

Figure 2 - Location of the SOME/IP TP module

#### 7.1 Overview of the SOME/IP header

This chapter describe the relevant parts of the SOME/IP header for the segmentation of SOME/IP messages.

The Message Type field of the SOME/IP header contains a bit, which marks the SOME/IP PDU as a segment of an original SOME/IP message. Every segmented SOME/IP message adds SOME/IP TP specific fields to the SOME/IP header.

These fields contain control information for the segmentation and the reassembly of original, large SOME/IP messages. How they are used is described in the following chapters.

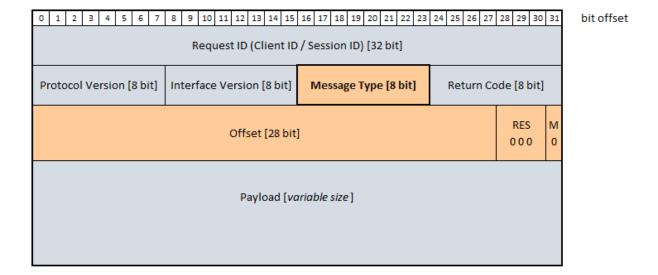

Figure 3 -SOME/IP TP header

**Note:** The Offset Field, the Reserved bits and the More Segment Flag are only present if the TP-Flag is set to '1'.

#### 7.1.1 Message Type Field

The Message Type Field contains the TP-Flag, which marks this SOME/IP message as a SOME/IP segment of an original SOME/IP message.

			Mess	age 7	Гуре [	8 bit]		
bit offset	16	17	18	19	20	21	22	23
Value	Х	Х	0/1	Х	Х	Х	Х	Х
Name	ignore	ignore	TP-Flag	ignore	ignore	ignore	ignore	ignore

Figure 4 - Location of the TP-Flag

#### 7.1.2 Offset Field

The Offset Field [28 bits] is located right after the Return Code field. It starts at bit offset 0, and ends at bit offset 27. The contained value increases after every transmitted/received segment according to the payload length of the previous transmitted/received SOME/IP segment.

The **Offset Field** contains the **Offset Value** in units of 16 bytes. (E.g.: If the Offset Field is set to 92, 1472 Payload bytes have been transmitted so far.) These two different terms are used in the remainder of this document.

**Note:** The payload length provided in the Offset Field does not include the bytes which are needed for the SOME/IP header.

#### 7.1.3 Reserved Field

The Reserved Field [3 bits] follows the Offset Field. It starts at bit offset 28 and ends at bit offset 30. These three bits are reserved and set to 0.

#### 7.1.4 More Segments Flag

The More Segments Flag [1 bit] indicates whether another segmented SOME/IP PDU will follow.

#### 7.1.5 Example

An original SOME/IP message of 5571 bytes payload has to be transmitted. The Length field of this original SOME/IP message is set to 8 + 5571 bytes.

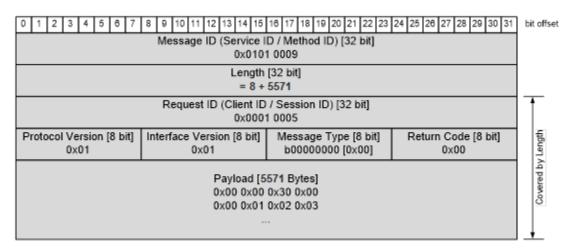

Figure 5 - Example: Header of Original SOME/IP message

This original SOME/IP message will now be segmented into 5 consecutive SOME/IP segments. Every payload of these segments carries at most 1392 bytes in this example.

For these segments, the SOME/IP TP module adds additional TP fields (marked red). The Length field of the SOME/IP carries the overall length of the SOME/IP segment including 8 bytes for the Request ID, Protocol Version, Interface Version, Message Type and Return Code. Because of the added TP fields (4 bytes), this Length information is extended by 4 additional SOME/IP TP bytes.

The following figure provides an overview of the relevant SOME/IP header settings for every SOME/IP segment:

	Length (Bytes)	Message Type [TP-Flag]	Offset value	More Segment Flag
-	8 + 4 + 1392 = 1404	•	0	1
2 <sup>nd</sup> segment	8 + 4 + 1392 = 1404	TP-Flag = '1'	87	1
3 <sup>rd</sup> segment	8 + 4 + 1392 = 1404	TP-Flag = '1'	174	1
4 <sup>th</sup> segment	8 + 4 + 1392 = 1404	TP-Flag = '1'	261	1
5 <sup>th</sup> segment	8 + 4 + 312 = 324	TP-Flag = '1'	348	0

Figure 6 – Example: Overview of relevant SOME/IP TP headers

**Note:** Please be aware that the value provided within the Offset Field is given in units of 16 bytes, i.e.: The Offset Value of 87 correspond to 1392 bytes Payload.

The complete SOME/IP headers of the SOME/IP segments message will look like this in detail:

• The first 4 segments contain 1392 Payload bytes each with "More Segments Flag" set to '1':

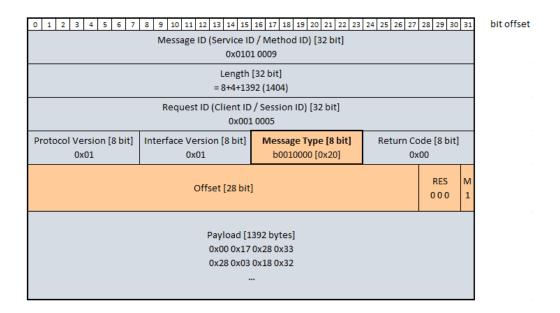

Figure 7 - Example: Header of the SOME/IP segments

 The last segment (i.e. #5) contains the remaining 312 Payload bytes of the original 5880 bytes payload. This last segment is marked with "More Segments flag" set to '0'.

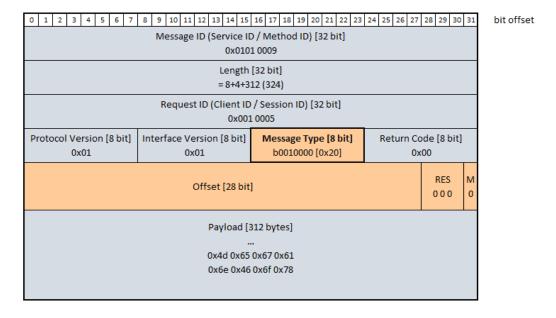

Figure 8 - Example: Header of the last SOME/IP segment

## 7.2 Segmentation of SOME/IP messages (TX Path)

The following chapter describe the necessary activities of the SOME/IP TP module to segment SOME/IP messages.

#### 7.2.1 Size of SOME/IP segments

#### [SWS\_SomelpTp\_00001][

The SOME/IP TP module shall remember the PDU length separately for every PDU ID which is passed by the PduInfoPtr parameter of the SomeIpTp\_Transmit() call.

| (RS\_SOMEIP\_00010, RS\_SOMEIP\_00011)

#### Note:

The SOME/IP TP module needs this information to calculate the payload size, the Offset Value, and the More Segments Flag for the SOME/IP segments which are going to be transmitted.

#### [SWS\_SomelpTp\_00002][

The amount of generated SOME/IP segments shall be as little as possible. J (RS\_SOMEIP\_00011, RS\_SOMEIP\_00010, RS\_SOMEIP\_00051)

**Note:** This means that the SOME/IP TP module shall try to always use the maximum allowed segmentation size.

#### [SWS\_SomelpTp\_00003][

The size of every segmented SOME/IP message shall consist of the sum of 12 bytes of SOME/IP header, and the Payload bytes itself.

| (RS SOMEIP 00011)

#### ISWS SomeIpTp 000041

The SOME/IP TP module shall derive the maximum possible size of the segmented SOME/IP PDUs using the parameter SomeIpTpTxNPduRef.

| (RS\_SOMEIP\_00011, RS\_SOMEIP\_00010, RS\_SOMEIP\_00051)

#### [SWS SomeIpTp 00005]

The SOME/IP TP module shall generate segmented SOME/IP PDUs not larger than the size derived from the parameter <code>SomeIpTpTxNPduRef</code>.

I (RS SOMEIP 00011, RS SOMEIP 00010, RS SOMEIP 00051)

#### [SWS SomeIpTp 00006]

Every payload of a segmented SOME/IP message except the last one has to be a multiple of 16 bytes.

| (RS\_SOMEIP\_00011, RS\_SOMEIP\_00010, RS\_SOMEIP\_00027)

#### Note:

The last segment may consist of an odd payload or a payload which is not dividable by 16. The amount of the contained payload bytes are written into the Length field of the SOME/IP header.

## [SWS\_SomelpTp\_00007][

The SOME/IP TP module shall buffer the pointer to the Meta-data for every PDU ID separately which is passed by the PduInfoPtr parameter of the API SomeIpTp\_Transmit(), and forward this information when PduR\_SomeIpTpTransmit() is called for each segment.

#### 7.2.2 Header of SOME/IP segments

Every generated SOME/IP header for each SOME/IP segment is set to the following values:

The following fields are received by the upper layer:

The following fields are added by the SOME/IP TP module:

Offset [28 bit] - calculated value, see SWS\_SomelpTp\_00011
 Reserved bits [3 bit] - statically set to '000', see SWS\_SomelpTp\_00012
 More Segment Flag [1 bit] - calculated value, see SWS\_SomelpTp\_00013

#### [SWS\_SomelpTp\_00008][

The SOME/IP TP module shall store the Request ID, Protocol Version, Interface Version, Message Type, and the Return Code of the SOME/IP header for every PDU ID separately which is returned by the first call of PduR\_SomeIpTpCopyTxData() triggered by the API call SomeIpTp\_Transmit(). | (RS\_SOMEIP\_00010)

#### Note:

The SOME/IP header is contained in the first 8 bytes of the total length of the original SOME/IP PDU. The total length is provided via the API call

SomeIpTp Transmit().

#### [SWS\_SomelpTp\_00009][

If the provided SDU fits into one single PDU, the provided SOME/IP header shall be used with no modification.

If the provided SDU does not fit into one single SOME/IP PDU, the SOME/IP TP module shall set the TP-Flag of the Message Type to '1' for every SOME/IP segment which is going to be sent on the bus via the PduR.

All the other bits contained in the Message Type field shall stay untouched.

| (RS\_SOMEIP\_00027, RS\_SOMEIP\_00051)

#### [SWS\_SomelpTp\_00010][

The SOME/IP TP module shall create and attach the Offset Field, the Reserved bits, and the More Segment Flag to every SOME/IP segment which is going to be sent on the bus.

] (RS\_SOMEIP\_00010, RS\_SOMEIP\_00027)

#### [SWS\_SomelpTp\_00011][

The Offset Field of the first SOME/IP segment shall be set to '0'. ] (RS\_SOMEIP\_00010, RS\_SOMEIP\_00027)

## [SWS\_SomelpTp\_00012][

The SOME/IP TP module shall increase the value of the Offset Field for every successfully transmitted SOME/IP segment by the amount of bytes which have been transmitted by the previous SOME/IP segment divided by 16.

[ (RS SOMEIP 00010, RS SOMEIP 00027, RS SOMEIP 00051)

#### [SWS\_SomelpTp\_00013][

The SOME/IP TP module shall set the Reserved bits statically to '000' by the sender and shall be ignored by the receiver.

| (RS SOMEIP 00010, RS SOMEIP 00027)

#### [SWS\_SomelpTp\_00014][

The SOME/IP TP module shall set the More Segment Flag to '1' except for the last SOME/IP segment.

| (RS\_SOMEIP\_00010, RS\_SOMEIP\_00027)

#### [SWS\_SomelpTp\_00015][

The SOME/IP TP module shall set the More Segment Flag to '0' for the last SOME/IP segment.

| (RS SOMEIP 00010, RS SOMEIP 00027)

#### 7.2.3 Sending of SOME/IP segments

#### [SWS\_SomelpTp\_00016][

If the API <code>SomeIpTp\_Transmit()</code> is called, the SOME/IP TP module shall check for an ongoing segmentation for the provided PDU ID. | (RS\_SOMEIP\_00010)

#### [SWS\_SomelpTp\_00017][

If the API <code>SomeIpTp\_Transmit()</code> is called while no segmentation is ongoing for this PDU ID, the SOME/IP TP module shall perform the following steps in the following order:

- Remember the provided PDU length (provided PduInfoPtr).
- Derive the PDU ID which shall be used for every segmented SOME/IP PDU (see SomeIpTpTxNPduRef).
- Calculate the size of the SOME/IP for the first segment (considering header and payload)
- Call the API PduR\_SomeIpTpTransmit() using the derived PDU ID and the calculated PDU size and set the SduDataPtr to NULL\_PTR.

| (RS\_SOMEIP\_00010)

#### [SWS\_SomelpTp\_00018][

When the API <code>SomeIpTp\_TriggerTransmit()</code> is called, create the header for the <code>SOME/IP</code> segment and call the API <code>PduR\_SomeIpTpCopyTxData()</code> using the calculated payload for this segment, and set the parameter <code>retry</code> to <code>NULL\_PTR</code>. <code>I (RS\_SOMEIP\_00010)</code>

#### [SWS SomelpTp 00019][

To calculate the possible maximum size for all consecutive SOME/IP TP segments, the SOME/IP TP module shall consider the available buffer size of the upper layer by evaluating the availableDataPtr, provided by the API PduR SomeIpTpCopyTxData().

I.e.:The payload size of the next SOME/IP TP segment needs to be smaller or equal to the available buffer, AND dividable by 16 for all segments but for the last. ] (RS\_SOMEIP\_00010, RS\_SOMEIP\_00738)

#### [SWS SomelpTp 00020]

The SOME/IP TP module shall debounce subsequent calls of the API PduR\_SomeIpTpTransmit() for the same PDU ID, using the parameter SomeIpTpNPduSeparationTime.

It defines the time span between the call of <code>SomeIpTp\_TxConfirmation()</code>, and the subsequent call of the API <code>PduR\_SomeIpTpTransmit()</code>. ] (RS\_SOMEIP\_00010)

## [SWS\_SomelpTp\_00021][

If the last SOME/IP segment of the original SOME/IP PDU has been transmitted successfully (i.e. the call of <code>SomeIpTp\_TxConfirmation()</code> with parameter success equals TRUE occurred for the last call of <code>PduR\_SomeIpTpCopyTxData())</code>, the SOME/IP TP module shall

• Call the API PduR\_SomeIpTpTxConfirmation(). ] (RS\_SOMEIP\_00010)

#### Note:

With the call of PduR\_SomeIpTpTxConfirmation(), the segmentation process is finished.

#### 7.2.4 Interruption of the disassembly process

#### [SWS\_SomelpTp\_00022][

If the API SomeIpTp\_Transmit() is called with a PDU ID which is currently used for an ongoing segmentation,

- E NOT OK shall be returned.
- The ongoing disassembly process for this PDU ID shall be canceled.
- The API PduR\_SomeIpTpTxConfirmation() with result set to E\_NOT\_OK shall be called.
- The API Det\_ReportRuntimeError() shall be called with the runtime error code SOMEIPTP\_E\_DISASSEMBLY\_INTERRUPT.

| (RS\_SOMEIP\_00010)

#### [SWS\_SomelpTp\_00023][

If the API SomeIpTp\_TxConfirmation() is called with parameter success set to FALSE,

- The disassembly process for this PDU ID shall be canceled.
- The API PduR\_SomeIpTpTxConfirmation() with result set to E NOT OK shall be called.
- The API Det\_ReportRuntimeError() shall be called with the runtime error code SOMEIPTP\_E\_DISASSEMBLY\_INTERRUPT.

| (RS\_SOMEIP\_00010, RS\_SOMEIP\_00738)

#### [SWS SomelpTp 00024][

If the availableDataPtr, provided by the API PduR\_SomeIpTpCopyTxData() is smaller than 16 bytes, or smaller than required for the last SOME/IP TP segment,

- The disassembly process for this PDU ID shall be canceled.
- The API PduR\_SomeIpTpTxConfirmation() with result set to E NOT OK shall be called.
- The API Det\_ReportRuntimeError() shall be called with the runtime error code SOMEIPTP\_E\_DISASSEMBLY\_INTERRUPT.

| (RS\_SOMEIP\_00010, RS\_SOMEIP\_00738)

#### [SWS\_SomelpTp\_00025][

If an API PduR\_SomeIpTpCopyTxData() returns something else than BUFREQ OK.

- The disassembly process for this PDU ID shall be canceled.
- The API PduR\_SomeIpTpTxConfirmation() with result set to E\_NOT\_OK shall be called.
- The API Det\_ReportRuntimeError() shall be called with the runtime error code SOMEIPTP\_E\_DISASSEMBLY\_INTERRUPT.

| (RS\_SOMEIP\_00010, RS\_SOMEIP\_00738)

## 7.3 Assembly of received SOME/IP messages (RX path)

## [SWS\_SomelpTp\_00026][

If the API <code>SomeIpTp\_RxIndication()</code> is called, the SOME/IP TP module shall derive the following SOME/IP header information from the first 12 bytes of the received PDU:

- Request ID [32 bit]
- Protocol Version [8 bit]
- Interface Version [8 bit]
- Message Type [8 bit]
- Return Code [8 bit]
- Offset [28 bit]
- Reserved bits [3 bit]
- More Segment Flag [1 bit]

| (RS\_SOMEIP\_00010, RS\_SOMEIP\_00010, RS\_SOMEIP\_00027)

#### [SWS\_SomelpTp\_00027][

The SOME/IP TP module shall be able to store the value of the Offset Field for every PDU ID separately.

] (RS\_SOMEIP\_00010)

#### [SWS SomelpTp 00028][

The SOME/IP TP module shall be able to store the number of Payload bytes for every PDU ID separately which has been passed by a call of

SomeIpTp\_RxIndication().

| (RS\_SOMEIP\_00010)

#### [SWS\_SomelpTp\_00029][

The SOME/IP TP module shall store the status of the More Segment Flag for every PDU ID separately which is passed by a call of  $SomeIpTP_RxIndication()$ . J (RS\_SOMEIP\_00010)

#### [SWS\_SomelpTp\_00030][

The SOME/IP TP module shall buffer the pointer to the Meta-data for every PDU ID separately which is passed by the PduInfoPtr parameter of the API SomeIpTp\_RxIndication(), and forward this information when PduR\_SomeIpTpStartOfReception is called.

]()

#### [SWS\_SomelpTp\_00031][

If SomeIpTp\_RxIndication() is called with TP Flag set to '0', SOME/IP TP shall call PduR\_SomeIpTpStartOfReception, PduR\_SomeIpTpCopyRxData(), and PduR\_SomeIpTpRxIndication(), directly after each other providing the received indication.

#### [SWS\_SomelpTp\_00071][

If SomeIpTp RxIndication() is called with

- TP Flag set to '1',
- Offset Field set to '0', and
- More Segment Flag set to '0',

SOME/IP TP shall call PduR\_SomeIpTpStartOfReception(),
PduR\_SomeIpTpCopyRxData(), and SomeIpTp\_RxIndication(), directly after
each other providing the received indication.
]()

#### 7.3.1 SOME/IP segment received with Offset 0

#### [SWS\_SomelpTp\_00032][

If a SOME/IP segment is successfully received with Offset Field set to 0, the SOME/IP TP module shall store the values of the received SOME/IP header for each PDU ID separately. These values shall be used as reference values for the (expected) following consecutive receiving SOME/IP segments (i.e. with Offset Field set to > 0).

| (RS\_SOMEIP\_00010)

## [SWS\_SomelpTp\_00033][

If a SOME/IP segment is successfully received with Offset Field set to 0, the SOME/IP TP module shall

- Start the Rx timeout time defined by SomeIpTpRxTimeoutTime.
- Call the API PduR\_SomeIpTpStartOfReception() with the PDU ID derived from the parameter SomeIpTpRxSduRef and the TpSduLength set to '0'.

| (RS\_SOMEIP\_00010)

#### Note:

TpSduLength set to '0' indicates "unknown message length" to the upper layers.

#### [SWS\_SomelpTp\_00034][

If a SOME/IP segment is successfully received with Offset Field set to 0 and after the SOME/IP TP module has called the API PduR\_SomeIpTpStartOfReception(), the SOME/IP TP module shall check the returned bufferSizePtr.

If the <code>bufferSizePtr</code> is greater or equal to the sum of the received payload and the added SOME/IP header, the SOME/IP TP module shall call the API <code>PduR\_SomeIpTpCopyRxData()</code> to pass the following assembled SOME/IP message. This PDU shall contain the following content:

- Request ID [32 bit]
- Protocol Version [8 bit]
- Interface Version [8 bit]
- Message Type [8 bit] see SWS\_SomelpTp\_00028
- Return Code [8 bit]
- [Payload]

| (RS\_SOMEIP\_00010)

#### [SWS\_SomelpTp\_00035][

The SOME/IP TP module shall set the TP-Flag contained in the Message Type back to '0' before the assembled SOME/IP header is passed to the upper layer. | (RS SOMEIP 00010, RS SOMEIP 00051)

#### [SWS\_SomelpTp\_00036][

The SOME/IP TP module shall store the number of Payload bytes for every PDU ID separately which has been passed to the upper layer.

J (RS\_SOMEIP\_00010)

#### Note:

This information will be used to verify the Offset Value of the consecutive SOME/IP segments.

#### 7.3.2 SOME/IP segment received with Offset> 0

#### [SWS\_SomelpTp\_00037][

If a SOME/IP segment is successfully received with Offset Field> 0, the SOME/IP TP module shall compare the received SOME/IP header fields with the values of the stored SOME/IP header fields which has been received with the first segment (i.e. Offset was set to 0):

- Request ID [32 bit]
- Protocol Version [8 bit]
- Interface Version [8 bit]
- Message Type [8 bit]
- Return Code [8 bit]

If these values match restart the SomeIpTpRxTimeoutTime and continue with the assembly process.

| (RS\_SOMEIP\_00010)

#### [SWS\_SomelpTp\_00038][

The SOME/IP TP module shall store the number of Payload bytes for every PDU ID separately which has been passed to the upper layer.

I (RS SOMEIP 00010)

#### [SWS\_SomelpTp\_00039][

The SOME/IP TP module shall compare the value of the Offset Field with the sum divided by 16 of copied Payload bytes since the first received SOME/IP segment (i.e. with Offset Field set to '0').

If this sum divided by 16 matches with the current Offset Value and if the bufferSizePtr provided by the previous call of the API

PduR\_SomeIpTpCopyRxData() is greater or equal to the received payload, call the API PduR\_SomeIpTpCopyRxData() with SduLength set to the received Payload bytes.

| (RS\_SOMEIP\_00010)

#### Note:

In case of Offset Field value > 0, only the Payload bytes are provided to the upper layer (without any SOME/IP header fields)

#### [SWS\_SomelpTp\_00040][

If a SOME/IP segment is successfully received with the More Segment Flag set to '0', the SOME/IP TP module shall

- Cancel the Rx timeout time defined by SomeIpTpRxTimeoutTime.
- Call the API PduR\_SomeIpTpRxIndication() after it has copied the remaining received Payload bytes to the upper layer(as defined in SWS\_SomeIpTp\_00033).

I (RS SOMEIP 00010)

#### 7.3.3 Interruption of the assembly process

#### [SWS\_SomelpTp\_00041][

If the Rx timeout time defined by SomeIpTpRxTimeoutTime expires,

- The current assembly process shall be interrupted as defined by SWS\_SomelpTp\_00054.
- The API Det\_ReportRuntimeError() shall be called with the runtime error code SOMEIPTP\_E\_ASSEMBLY\_INTERRUPT.

| (RS\_SOMEIP\_00010, RS\_SOMEIP\_00738)

#### [SWS\_SomelpTp\_00042][

If the API SomeIpTp\_RxIndication() is called with the Offset Value is > 0 but no session is currently running,

- The received PDU shall be ignored
- The API Det\_ReportRuntimeError() shall be called with the runtime error code SOMEIPTP\_E\_INCONSISTENT\_SEQUENCE.

] (RS\_SOMEIP\_00010, RS\_SOMEIP\_00051)

**Note:** This check identifies that at least the first segment has not been received.

#### [SWS SomelpTp 00054][

If the SOME/IP TP module interrupts the assembly process because of a detected error, the SOME/IP TP module shall

- Call the API PduR\_SomeIpTpRxIndication() for this PDU ID with E NOT OK.
- The Rx timeout time defined by SomeIpTpRxTimeoutTime shall be canceled (if still running) for this PDU ID.

| (RS\_SOMEIP\_00010)

**Note:** The possible reasons for interruptions are listed below.

#### [SWS\_SomelpTp\_00062][

If the SOME/IP TP module detects an inconsistency of the received SOME/IP TP headers (i.e.: Request ID, Protocol Version, Interface Version, Message Type or Return Code are not equal for all received segments),

- The current assembly process shall be interrupted as defined by SWS\_SomelpTp\_00054.
- The API Det\_ReportRuntimeError() shall be called with the runtime error code SOMEIPTP\_E\_INCONSISTENT\_HEADER.

I (RS SOMEIP 00010)

#### [SWS\_SomelpTp\_00045][

If the API <code>SomeIpTp\_RxIndication()</code> is called and a session is currently active, the SOME/IP TP module shall check if the TP-Flag of the Message Type is set to '1'. If the TP-Flag is not set to '1',

- The current assembly process shall be interrupted as defined by SWS\_SomelpTp\_00054.
- The API Det\_ReportRuntimeError() shall be called with the runtime error code SOMEIPTP\_E\_MESSAGE\_TYPE.

J (RS\_SOMEIP\_00010)

#### [SWS\_SomelpTp\_00063][

If the API <code>SomeIpTp\_RxIndication()</code> is called, the SOME/IP TP module shall check whether the received payload bytes are dividable by16 in case the More Segment Flag is set to '1'.

If the received payload bytes are not dividable by 16 in this case,

- The current assembly process shall be interrupted as defined by SWS\_SomelpTp\_00054.
- The API Det\_ReportRuntimeError() shall be called with the runtime error code SOMEIPTP\_E\_ASSEMBLY\_INTERRUPT.

| (RS\_SOMEIP\_00010, RS\_SOMEIP\_00051)

#### [SWS\_SomelpTp\_00064][

If the API <code>SomeIpTp\_RxIndication()</code> is called, the SOME/IP TP module shall check the value of the Offset Field. If the Offset Value in units of 16 bytes does not match to the sum of the received Payload bytes of the previous SOME/IP segments,

- The current assembly process shall be interrupted as defined by SWS SomelpTp 00054.
- The API Det\_ReportRuntimeError() shall be called with the runtime error code SOMEIPTP\_E\_INCONSISTENT\_SEQUENCE.

(RS SOMEIP 00010, RS SOMEIP 00051)

#### [SWS\_SomelpTp\_00048][

If the API <code>SomeIpTp\_RxIndication()</code> is called, the SOME/IP TP module shall check the value of the Offset Field. If the received Offset Value equals '0' while the received Payload bytes of the previous SOME/IP segments is greater than '0', the SOME/IP TP module shall perform the following steps in the following order:

- The current assembly process shall be interrupted as defined by SWS SomelpTp\_00054.
- The API Det\_ReportRuntimeError() shall be called with the runtime error code SOMEIPTP E INCONSISTENT SEQUENCE.
- Start the assembly process according to chapter 7.3.1 SOME/IP segment received with Offset 0

I (RS SOMEIP 00010, RS SOMEIP 00051)

## [SWS\_SomelpTp\_00049][

If the bufferSizePtr provided by the API  $PduR\_SomeIpTpStartOfReception$  () or  $PduR\_SomeIpTpCopyRxData$  () is smaller than the sum of the received and the added SOME/IP header (in case of the first segment) or the received payload (in case of any subsequent segment),

- The current assembly process shall be interrupted as defined by SWS\_SomelpTp\_00054.
- The API Det\_ReportRuntimeError() shall be called with the runtime error code SOMEIPTP\_E\_ASSEMBLY\_INTERRUPT.

| (RS\_SOMEIP\_00010)

#### [SWS\_SomelpTp\_00050][

If the API  $PduR\_SomeIpTpCopyRxData()$  returns something else than BUFREQ OK.

- The assembly process for this PDU ID shall be interrupted as defined by SWS\_SomelpTp\_00054.
- •
- The API Det\_ReportRuntimeError() shall be called with the runtime error code SOMEIPTP\_E\_ASSEMBLY\_INTERRUPT.

| (RS\_SOMEIP\_00010, RS\_SOMEIP\_00738)

## [SWS\_SomeIpTp\_00051][

If the API PduR\_SomeIpTpStartOfReception() returns something else than BUFREQ OK.

- The assembly process for this PDU ID shall be stopped.
- The API Det\_ReportRuntimeError() shall be called with the runtime error code SOMEIPTP\_E\_ASSEMBLY\_INTERRUPT.

I (RS SOMEIP 00010, RS SOMEIP 00738)

## 7.4 Error classification

#### 7.4.1 Development Errors

The following Development Errors can be detected by the SOME/IP TP module

## [SWS\_SomelpTp\_00052][Development Error Types

Type of error	Related error code	Value [hex]
SOME/IP TP module not initialized	SOMEIPTP_E_UNINIT	0x01
Null pointer has been passed as an argument	SOMEIPTP_E_PARAM_POINTER	0x02
Unknown parameter has been passed	SOMEIPTP_E_PARAM	0x03

]()

#### 7.4.2 Runtime Errors

#### [SWS\_SomelpTp\_00065] Runtime Error Types

Type of error	Related error code	Value [hex]
The TP-Flag (of Message Type) was set to ,0'	SOMEIPTP_E_MESSAGE_TYPE	0x04
Inconsistent subsequent segment received	SOMEIPTP_E_INCONSISTENT_SEQUENCE	0x05
Inconsistent header received	SOMEIPTP_E_INCONSISTENT_HEADER	0x06
Disassembly Interrupt due to the upper layer	SOMEIPTP_E_DISASSEMBLY_INTERRUPT	0x07
Assembly Interrupt due to the upper layer	SOMEIPTP_E_ASSEMBLY_INTERRUPT	0x08

]()

#### 7.4.3 Transient Faults

There are no extended production errors.

#### 7.4.4 Production Errors

There are no production errors.

#### 7.4.5 Extended Production Errors

There are no extended production errors.

# 8 API specification

# 8.1 Imported types

In this chapter all types included from the following modules are listed:

[SWS SomelpTp 00043] [

, or to _ oom or p : p _ ood : o ]			
Module	Header File	Imported Type	
ComStack_Types	ComStackTypes.h	BufReq_ReturnType	
	ComStackTypes.h	PduldType	
	ComStackTypes.h	PduInfoType	
	ComStackTypes.h	PduLengthType	
	ComStackTypes.h	RetryInfoType	
Std_Types	StandardTypes.h	Std_ReturnType	
	StandardTypes.h	Std_VersionInfoType	

(SRS\_BSW\_00301)

# 8.2 Type definitions

[SWS\_SomelpTp\_91002] [

Name:	SomeIpTp_ConfigType
Type:	Structure
	implementation specific
	This type shall contain at least all parameters that are post-build able according to chapter 10.
Available via:	SomeIpTp.h

]()

#### 8.3 Function definitions

#### 8.3.1 SomelpTp\_GetVersionInfo

[SWS\_SomelpTp\_00044] [

<u> </u>	<u> </u>		
Service name:	SomeIpTp_GetVersionInfo		
Syntax:	<pre>void SomeIpTp_GetVersionInfo(</pre>		
	Std_VersionInfoType* VersionInfo		
Service ID[hex]:	0x01		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant		
Parameters (in):	None		
Parameters	None		
(inout):			
Parameters (out):	VersionInfo Pointer to where to store the version information of this module.		
Return value:	None		
Description:	Returns the version information of this module.		
Available via:	SomeIpTp.h		

(SRS\_BSW\_00407,SRS\_BSW\_00411)

## [SWS\_SomelpTp\_00066] [

If the parameter SomelpTp\_VersionInfoPtr of the API

SomeIpTp\_GetVersionInfo() equals NULL\_PTR and if development error detection is enabled (i.e. SomeIpTpDevErrorDetect is set to TRUE), the function SomeIpTp\_GetVersionInfo, the API Det\_ReportError() shall be called with the development error code SOMEIPTP\_E\_PARAM\_POINTER.

## 8.3.2 SomelpTp\_Init

[SWS\_SomelpTp\_00046] [

<u> </u>		
Service name:	SomeIpTp_Init	
Syntax:	<pre>void SomeIpTp_Init(</pre>	
	<pre>const SomeIpTp_ConfigType* config</pre>	
Service ID[hex]:	0x02	
Sync/Async:	Synchronous	
Reentrancy:	Non Reentrant	
Parameters (in):	config Base pointer to the configuration structure of the SOME/IP TP module.	
Parameters	None	
(inout):		
Parameters (out):	None	
Return value:	None	
Description:	Initializes the SOME/IP TP module.	
Available via:	SomeIpTp.h	

(SRS\_BSW\_00407,SRS\_BSW\_00411)

#### Note:

The AUTOSAR ECU StateManager calls this SOME/IP TP API service with the address of the static configuration structure of the module in parameter SomelpTp\_ConfigPtr.

## 8.3.3 SomelpTp\_Transmit

[SWS\_SomelpTp\_00047] [

Service name:	SomeIpTp_Transmit	
Syntax:	Std_ReturnType SomeIpTp_Transmit(     PduIdType TxPduId,     const PduInfoType* PduInfoPtr )	
Service ID[hex]:	0x49	
Sync/Async:	Synchronous	
Reentrancy:	Reentrant for different Pdulds. Non reentrant for the same Pduld.	
Parameters (in):	TxPduld	Identifier of the PDU to be transmitted
	PduInfoPtr	Length of and pointer to the PDU data and pointer to MetaData.
Parameters (inout):	None	
Parameters (out):	None	
Return value:		E_OK: Transmit request has been accepted. E_NOT_OK: Transmit request has not been accepted.
Description:	Requests transmission of a PDU.	
Available via:	SomeIpTp.h	

]()

## [SWS\_SomelpTp\_00052] [

If  $SomeIpTp\_Transmit()$  is called before the SOME/IP TP module has been initialized with a call of  $SomeIpTp\_Init()$ , the AP shall return with E\_NOT\_OK and stop the new session. ]()

#### [SWS\_SomelpTp\_00048][

If development error detection is enabled: SomeIpTp\_Transmit() shall check that the service SomeIpTp\_Init() was previously called. If the check fails, SomeIpTp\_Transmit() shall raise the development error SOMEIPTP\_E\_UNINIT.
]()

## [SWS\_SomelpTp\_00049] [

If parameter TxPduId of SomeIpTp\_Transmit() has an invalid value and if development error detection is enabled (i.e. SomeIpTpDevErrorDetect is set to TRUE), the API Det\_ReportError() shall be called with the development error code SOMEIPTP\_E\_PARAM.

[()

#### [SWS\_SomelpTp\_00050][

If parameter PduInfoPtr of SomeIpTp\_Transmit() equals NULL\_PTR and if development error detection is enabled (i.e. SomeIpTpDevErrorDetect is set to TRUE), the API Det\_ReportError() shall be called with the development error code SOMEIPTP\_E\_PARAM\_POINTER.
]()

#### 8.4 Call-back notifications

#### 8.4.1 SomelpTp\_TriggerTransmit

[SWS\_SomelpTp\_00053] [

<u>[5W5_5omerp1p</u>	<u></u>		
Service name:	SomelpTp_TriggerTransmit		
Syntax:	<pre>Std_ReturnType SomeIpTp_TriggerTransmit(     PduIdType TxPduId,     PduInfoType* PduInfoPtr )</pre>		
Service ID[hex]:	0x41		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant for diff	erent Pdulds. Non reentrant for the same Pduld.	
Parameters (in):	TxPduId	ID of the SDU that is requested to be transmitted.	
Parameters (inout):	PduInfoPtr	Contains a pointer to a buffer (SduDataPtr) to where the SDU data shall be copied, and the available buffer size in SduLengh. On return, the service will indicate the length of the copied SDU data in SduLength.	
Parameters (out):	None		
Return value:		E_OK: SDU has been copied and SduLength indicates the number of copied bytes. E_NOT_OK: No SDU data has been copied. PduInfoPtr must not be used since it may contain a NULL pointer or point to invalid data.	
Description:	Within this API, the upper layer module (called module) shall check whether the available data fits into the buffer size reported by PduInfoPtr->SduLength.  If it fits, it shall copy its data into the buffer provided by PduInfoPtr->SduDataPtr and update the length of the actual copied data in PduInfoPtr->SduLength.  If not, it returns E_NOT_OK without changing PduInfoPtr.		
Available via:	SomeIpTp.h		

I()

#### [SWS\_SomelpTp\_00072]

If development error detection is enabled: SomeIpTp\_TriggerTransmit() shall check that the service SomeIpTp\_Init() was previously called. If the check fails, SomeIpTp\_TriggerTransmit() shall raise the development error SOMEIPTP\_E\_UNINIT.

]()

[SWS\_SomelpTp\_00055][In case the given PduInfoPtr->SduLength is smaller than the actual PDU-length, SomeIpTp\_TriggerTransmit() shall not copy any data and return E\_NOT\_OK.

|()

#### 8.4.2 SomelpTp\_RxIndication

[SWS\_SomelpTp\_00056] [

<u>[0110_00  10  b  </u>			
Service name:	SomeIpTp_RxIndication		
Syntax:	<pre>void SomeIpTp_RxIndication(     PduIdType RxPduId,     const PduInfoType* PduInfoPtr )</pre>		
Service ID[hex]:	0x42		
Sync/Async:	Synchronous		
Reentrancy:	Reentrant for different Pdulds. Non reentrant for the same Pduld.		
	RxPduld ID of the received PDU.		
Parameters (in):	PduInfoPtr Contains the length (SduLength) of the received PDU, a pointer to a buffer (SduDataPtr) containing the PDU, and the MetaData related to this PDU.		
Parameters	None		
(inout):			
Parameters (out):	None		
Return value:	None		
Description:	Indication of a received PDU from a lower layer communication interface module.		
Available via:	SomeIpTp.h		

1 ()

### [SWS\_SomeIpTp\_00057]

If development error detection is enabled: SomeIpTp\_RxIndication() shall check that the service SomeIpTp\_Init() was previously called. If the check fails, SomeIpTp\_RxIndication() shall raise the development error SOMEIPTP\_E\_UNINIT.

]()

## 8.4.3 SomelpTp\_TxConfirmation

[SWS\_SomelpTp\_91001] [

Service name:	SomeIpTp_TxConfirmation			
Syntax:	<pre>void SomeIpTp_TxConfirmation(     PduIdType TxPduId,</pre>			
	Std_ReturnType result			
Service ID[hex]:	0x40	0x40		
Sync/Async:	Synchronous			
Reentrancy:	Reentrant for different Pdulds. Non reentrant for the same Pduld.			
	TxPduld	ID of the PDU that has been transmitted.		
Parameters (in):	result E_OK: The PDU was transmitted. E_NOT_OK: Transmission of the PDU failed.			
Parameters (inout):	None			
Parameters (out):	None			
Return value:	None			
Description:	The lower layer communication interface module confirms the transmission of a PDU, or the failure to transmit a PDU.			
Available via:	SomeIpTp.h			

1 ()

### [SWS\_SomelpTp\_00067][

If development error detection is enabled: SomeIpTp\_TxConfirmation() shall check that the service SomeIpTp\_Init() was previously called. If the check fails, SomeIpTp\_TxConfirmation() shall raise the development error SOMEIPTP\_E\_UNINIT.

]()

#### 8.5 Scheduled functions

#### 8.5.1 SomelpTp\_MainFunctionTx

[SWS\_SomelpTp\_00058] [

<u> </u>	
Service name:	SomeIpTp_MainFunctionTx
Syntax:	void SomeIpTp_MainFunctionTx(
	void
	)
Service ID[hex]:	0x03
Description:	This function performs the processing of the AUTOSAR SOME/IP TP module's
	transmission activities.
Available via:	SchM_SomeIpTp.h

(SRS\_BSW\_00373, SRS\_BSW\_00425)

[SWS\_SomeIpTp\_00059][A call to <code>SomeIpTp\_MainFunctionTx()</code> shall simply return if the AUTOSAR SOME/IP TP module was not previously initialized with a call to <code>SomeIpTp\_Init().](SRS\_BSW\_00425)</code>

#### 8.5.2 SomelpTp\_MainFunctionRx

[SWS\_SomelpTp\_00069] [

<u>[0110_0011101b1k</u>	2_00000]		
Service name:	SomeIpTp_MainFunctionRx		
Syntax:	void SomeIpTp_MainFunctionRx(		
	void		
Service ID[hex]:	0x04		
Description:	This function performs the processing of the AUTOSAR SOME/IP TP module's		
	reception activities.		
Available via:	SchM SomeIpTp.h		

(SRS\_BSW\_00373, SRS\_BSW\_00425)

[SWS\_SomelpTp\_00070][A call to <code>SomeIpTp\_MainFunctionRx()</code> shall simply return if the AUTOSAR SOME/IP TP module was not previously initialized with a call to <code>SomeIpTp\_Init().](SRS\_BSW\_00425)</code>

## 8.6 Expected Interfaces

In this chapter all external interfaces required from other modules are listed.

#### 8.6.1 Mandatory Interfaces

This chapter defines all external interfaces which are required to fulfill the core functionality of the module.

[SWS\_SomelpTp\_00060] [

API function	Header File	Description		
Det_ReportRuntimeError	Det.h	Service to report runtime errors. If a callout has been configured then this callout shall be called.		
PduR_SomelpTpCopyRxData		This function is called to provide the received data of an I-PDU segment (N-PDU) to the upper layer.  Each call to this function provides the next part of the I-PDU data.  The size of the remaining buffer is written to the position indicated by bufferSizePtr.		
PduR_SomelpTpCopyTxData		This function is called to acquire the transmit data of an I-PDU segment (N-PDU). Each call to this function provides the next part of the I-PDU data unless retry->TpDataState is TP_DATARETRY. In this case the function restarts to copy the data beginning at the offset from the current position indicated by retry->TxTpDataCnt. The size of the remaining data is written to the position indicated by availableDataPtr.		
PduR_SomeIpTpRxIndication		Called after an I-PDU has been received via the TP API, the result indicates whether the transmission was successful or not.		
PduR_SomeIpTpStartOfReception		This function is called at the start of receiving an N-SDU. The N-SDU might be fragmented into multiple N-PDUs (FF with one or more following CFs) or might consist of a single N-PDU (SF). The service shall provide the currently available maximum buffer size when invoked with TpSduLength equal to 0.		
PduR_SomeIpTpTransmit	PduR_SomelpTp.h	Requests transmission of a PDU.		
PduR_SomeIpTpTxConfirmation	PduR_SomeIpTp.h	This function is called after the I-PDU has been transmitted on its network, the result indicates whether the transmission was successful or not.		

(SRS\_BSW\_00384)

#### 8.6.2 Optional Interfaces

This chapter defines all external interfaces which are required to fulfill an optional functionality of the module.

[SWS\_SomelpTp\_00061] [

API function Header	File Description

Det_ReportError	Det.h	Service to report development errors.
-----------------	-------	---------------------------------------

J (SRS\_BSW\_00384)

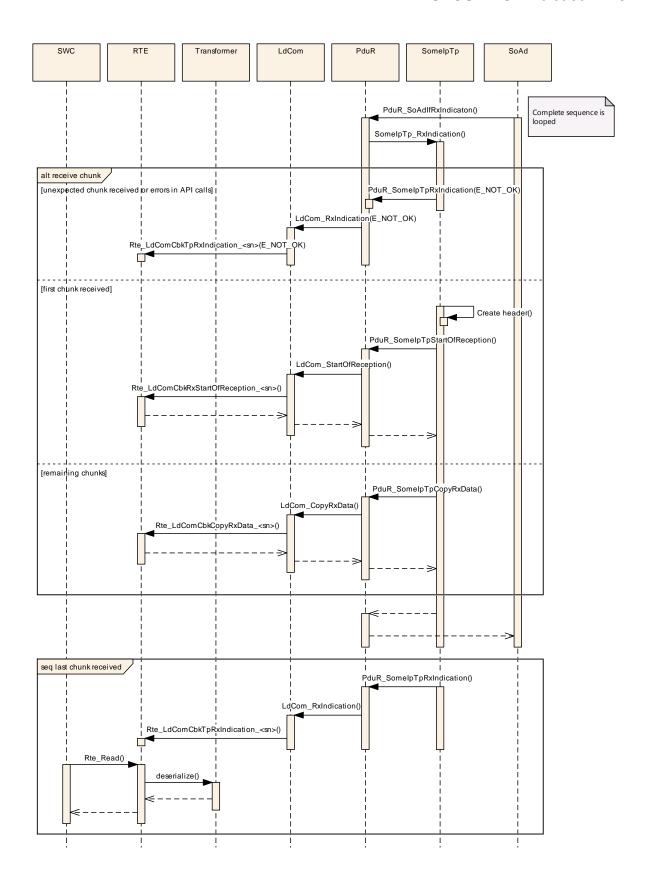

## 8.6.3 Configurable interfaces

N/A

- 9 Sequence diagrams
- 9.1 Reception

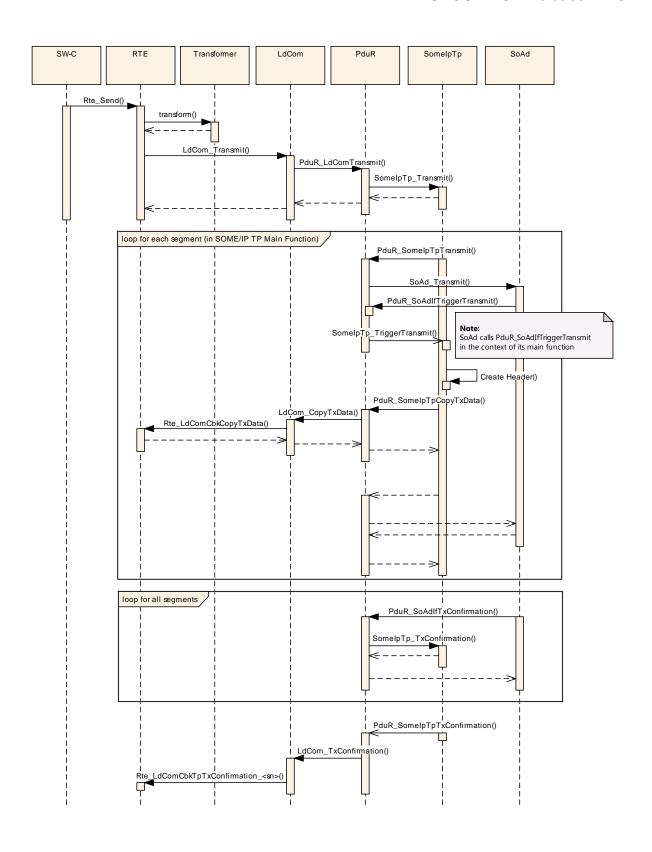

Sequence 9-1 Reception of SOME/IP segments

## 9.2 Transmission

Sequence 9-2 Transmission of SOME/IP segments

## 10 Configuration specification

Chapter 10.1 specifies the structure (containers) and the parameters of the module SOME/IP TP.

Chapter 10.2 specifies additionally published information of the module SOME/IP TP.

## 10.1 Containers and configuration parameters

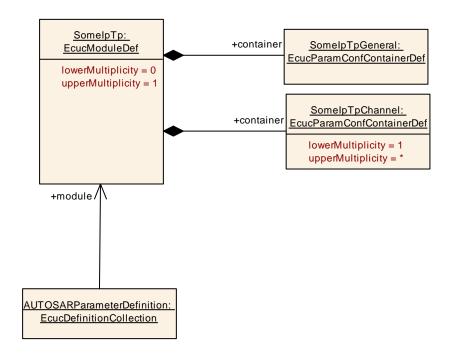

The following chapters summarize all configuration parameters. The detailed meanings of the parameters describe Chapters 7 and Chapter 8.

#### 10.1.1 SomelpTp

SWS Item	ECUC_SomelpTp_00001 :			
Module Name	SomelpTp			
Module Description	Configuration of the SomelpTp module.			
Post-Build Variant Support	true			
Supported Config Variants	VARIANT-LINK-TIME, VARIANT-POST-BUILD, VARIANT-PRE-COMPILE			

Included Containers			
Container Name	Multiplicity	ty Scope / Dependency	
SomelpTpChannel	1 1 "	This container contains the configuration parameters of the SomelpTp channel.	
SomelpTpGeneral		This container contains the general configuration parameters of the SomelpTp module.	

### 10.1.2 SomelpTpGeneral

SWS Item	ECUC_SomelpTp_00002:
Container Name	SomelpTpGeneral
Description	This container contains the general configuration parameters of the SomelpTp module.
Configuration Parameters	

SWS Item	ECUC_SomelpTp_00004 :			
Name	SomeIpTpDevErrorDetect SomeIpTpDevErrorDetect			
Parent Container	SomelpTpGeneral			
Description	Switches the Development Error Detection and Notification ON or OFF.			
Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value				
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Χ	All Variants	
	Link time

Name	SomelpTpVersionInfoApi			
Parent Container	SomelpTpGeneral			
Description	Activates the SomelpTp_GetVersionInfo() API. TRUE: Enables the SomelpTp_GetVersionInfo() API. FALSE: SomelpTp_GetVersionInfo() API is not included.			
Multiplicity	1			
Туре	EcucBooleanParamDef			
Default value	false			
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Pre-compile time X All Variants		
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

## No Included Containers

## 10.1.3 SomelpTpChannel

SWS Item	ECUC_SomeIpTp_00003:			
Container Name	SomelpTpChannel	SomelpTpChannel		
Description	This container contains the configuration parameters of the SomeIpTp channel.			
Post-Build Variant Multiplicity	true			
Multiplicity Configuration	Pre-compile time X VARIANT-PRE-COMPILE			
Class	Link time X VARIANT-LINK-TIME			
	Post-build time	Χ	VARIANT-POST-BUILD	
Configuration Parameters			_	

SWS Item	ECUC_SomelpTp_00006:				
Name	SomeIpTpNPduSeparationT	ime			
Parent Container	SomelpTpChannel	SomelpTpChannel			
Description	Sets the duration of the minimum time in seconds the SomeIpTp module shall wait between the transmissions of N-PDUs.				
Multiplicity	1				
Туре	EcucFloatParamDef				
Range	]0 INF[				
Default value					
Post-Build Variant Value	true				
Value Configuration Class	Pre-compile time	Χ	VARIANT-PRE-COMPILE		
	Link time	Χ	VARIANT-LINK-TIME		
	Post-build time	Χ	VARIANT-POST-BUILD		
Scope / Dependency	scope: local				

SWS Item	ECUC_SomelpTp_00023:

Name	SomeIpTpRxTimeoutTime			
Parent Container	SomelpTpChannel			
Description	Timer to monitor the successful reception. It is started when the first NPdu is received, restarted after reception of intermediate NPdus, and is stopped when the last NPdu has been received. The value shall be calculated as follows: (SomeIpTpRxTimeoutTime = SomeIpTpNPduSeparationTime + budget), where the time budget compensates intermediary hops and jitters within the ECU implementation.			
Multiplicity	1			
Туре	EcucFloatParamDef			
Range	]0 INF[			
Default value				
Post-Build Variant Value	true			
Value Configuration Class	Pre-compile time	Χ	VARIANT-PRE-COMPILE	
	Link time X VARIANT-LINK-TIME			
	Post-build time X VARIANT-POST-BUILD			
Scope / Dependency	scope: local			

Included Containers		
Container Name	Multiplicity	Scope / Dependency
SomelpTpRxNSdu	0*	The following parameters needs to be configured for each N-SDU which has to be passed as one assembled RxPdu to the upper layer.
SomelpTpTxNSdu	0*	The following parameters needs to be configured for each N-SDU that the SomelpTp module transmits via the SomelpTpChannel.

## 10.1.4 SomelpTpRxNSdu

SWS Item	ECUC_SomeIpTp_00008:		
Container Name	SomelpTpRxNSdu		
Description	The following parameters needs to be configured for each N-SDU which has to be passed as one assembled RxPdu to the upper layer.		
Post-Build Variant Multiplicity	true		
Multiplicity Configuration	Pre-compile time X VARIANT-PRE-COMPILE		
Class	Link time	Χ	VARIANT-LINK-TIME
	Post-build time	Χ	VARIANT-POST-BUILD
Configuration Parameters			

SWS Item	ECUC_SomelpTp_00010:			
Name	SomelpTpRxSduRef			
Parent Container	SomelpTpRxNSdu			
Description	Reference to a Pdu in the Co	Reference to a Pdu in the COM-Stack that represents the assembled		
	RxPdu which is passed via the PduR to the upper layer.			
Multiplicity	1			
Туре	Reference to [ Pdu ]			
Post-Build Variant Value	true			
Value Configuration Class	Pre-compile time X VARIANT-PRE-COMPILE			
	Link time X VARIANT-LINK-TIME			
	Post-build time X VARIANT-POST-BUILD			
Scope / Dependency				

Included Containers		
Container Name	Multiplicity	Scope / Dependency
SomeIpTpRxNPdu		This container contains the configuration parameters of the NPdu that is received from a lower layer

## 10.1.5 SomelpTpRxNPdu

SWS Item	ECUC_SomelpTp_00011 :
Container Name	SomelpTpRxNPdu
II IASCRINTIAN	This container contains the configuration parameters of the NPdu that is received from a lower layer
Configuration Parameters	

SWS Item	ECUC_SomeIpTp_00013:				
Name	SomelpTpRxNPduHandleId	SomelpTpRxNPduHandleId			
Parent Container	SomelpTpRxNPdu				
Description	This parameter defines the handle ID that is used by the PduR when calling SomeIpTp_RxIndication.				
Multiplicity	1				
Туре	EcucIntegerParamDef (Symbolic Name generated for this parameter)				
Range	0 65535				
Default value					
Post-Build Variant Value	false				
Value Configuration Class	Pre-compile time	Χ	All Variants		
	Link time				
	Post-build time				
Scope / Dependency	scope: local				

SWS Item	ECUC_SomeIpTp_00012 :			
Name	SomelpTpRxNPduRef			
Parent Container	SomelpTpRxNPdu			
Description	Reference to a global Pdu that is used to harmonize HandleIDs in the COM-Stack.			
Multiplicity	1			
Туре	Reference to [ Pdu ]			
Post-Build Variant Value	true			
Value Configuration Class	Pre-compile time X VARIANT-PRE-COMPILE			
	Link time X VARIANT-LINK-TIME			
	Post-build time X VARIANT-POST-BUILD			
Scope / Dependency				

#### No Included Containers

## 10.1.6 SomelpTpTxNSdu

SWS Item	ECUC_SomeIpTp_00009:		
Container Name	SomelpTpTxNSdu		
Description	The following parameters needs to be configured for each N-SDU that the SomeIpTp module transmits via the SomeIpTpChannel.		
Post-Build Variant Multiplicity	true		
Multiplicity Configuration	Pre-compile time X VARIANT-PRE-COMPILE		
Class	Link time X VARIANT-LINK-TIME		
	Post-build time	Χ	VARIANT-POST-BUILD
Configuration Parameters			

SWS Item	ECUC_SomelpTp_00020 :			
Name	SomelpTpTxNSduHandleId			
Parent Container	SomelpTpTxNSdu			
Description	This parameter defines the handle ID of the NSdu that represents the original TxSdu which is segmented and passed via the PduR to the lower layer. This handle ID is used by PduR when calling SomelpTp_Transmit.			
Multiplicity	1			
Туре	EcucIntegerParamDef (Symbolic Name generated for this parameter)			
Range	0 65535			
Default value				
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time X All Variants			
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_SomelpTp_00015 :			
Name	SomelpTpTxNSduRef			
Parent Container	SomelpTpTxNSdu			
Description	Reference to a global Pdu in the COM-Stack that represents the original TxSdu which is segmented and passed via the PduR to the lower layer.			
Multiplicity	1			
Туре	Reference to [ Pdu ]			
Post-Build Variant Value	true			
Value Configuration Class	Pre-compile time X VARIANT-PRE-COMPILE			
	Link time X VARIANT-LINK-TIME			
	Post-build time X VARIANT-POST-BUILD			
Scope / Dependency		•		

Included Containers		
Container Name	Multiplicity	Scope / Dependency
SomeIpTpTxNPdu	1 1	This container contains the configuration parameters of the segmented Tx NPdus that are transmitted to a lower layer.

## 10.1.7 SomelpTpTxNPdu

SWS Item	ECUC_SomelpTp_00016 :
Container Name	SomelpTpTxNPdu

Description	This container contains the configuration parameters of the segmented Tx NPdus that are transmitted to a lower layer.
Configuration Parameters	

SWS Item	ECUC_SomeIpTp_00017:			
Name	SomelpTpTxNPduHandleId			
Parent Container	SomelpTpTxNPdu			
Description	This parameter defines the handle ID that is used by PduR when calling SomelpTp_TriggerTransmit.			
Multiplicity	1			
Туре	EcucIntegerParamDef (Symbolic Name generated for this parameter)			
Range	0 65535			
Default value				
Post-Build Variant Value	false			
Value Configuration Class	Pre-compile time	Χ	All Variants	
	Link time			
	Post-build time			
Scope / Dependency	scope: local			

SWS Item	ECUC_SomeIpTp_00018:				
Name	SomelpTpTxNPduRef	SomelpTpTxNPduRef			
Parent Container	SomelpTpTxNPdu				
Description	Reference to a global Pdu that is used to harmonize HandleIDs in the COM-Stack.				
Multiplicity	1	1			
Туре	Reference to [ Pdu ]				
Post-Build Variant Value	true				
Value Configuration Class	Pre-compile time X VARIANT-PRE-COMPILE				
	Link time X VARIANT-LINK-TIME				
	Post-build time X VARIANT-POST-BUILD				
Scope / Dependency
